NVIDIA's Maxwell is getting ready to come in game, with new games, new screens, and even new features. NVIDIA launched its newest Maxwell graphics card, the GeForce GTX 980. The GTX 980 is the follow up to the previous generation GeForce GTX Titan, and is a new graphics card that is going to bring a revolution in NVIDIA's graphics cards. It has been a long time since NVIDIA has released a new graphics card that has an entire new architecture in it, that is faster than the previous. Now, the GeForce GTX 980 has a whopping 6GB of GDDR5 memory that are connected to a 2048-bit memory bus, which can support up to 1,152 Gbps of memory bandwidth. This graphics card has an incredible new architecture that is aimed for high performance and efficiency. So, what are we looking at? Well, we have a graphics card that has a Boost clock of 1,578MHz, which is slightly faster than its predecessor, the GTX Titan. This graphics card has a total of 2,304 CUDA cores, which is the same amount as the Titan, and those CUDA cores are combined together with the new architecture, which has a higher clock frequency, and they will be even faster. The graphics card has 12 shader processors, which are known as SMMs, and these SMMs have the capability of supporting 2,048 CUDA cores. This graphics card has an incredible 256-bit memory interface. The memory is a little bit slower than the Titan, which has a total of 256-bit memory interface, and the memory will be GDDR5, which means that it can transfer data at 1,066 MHz. The memory clock is 10 GHz, and has a memory buffer of 8,192MB, which is 12% more than the Titan. The graphics card has a TDP of 180W. This means that you are not going to find a higher graphics card than this, with a 180W TDP. This

is amazing, considering that the graphics card that it is going to be next to is a 275W TDP graphics card. The graphics card has a DVI, DisplayPort, HDMI, and a USB port. The graphics card has 2 SLI connectors, and the outputs are DisplayPort. The card has a price of \$599, and 2edc1e01e8
